

BHAWANIPUR GLOBAL CAMPUS

(An Autonomous Institution)

RAINWATER HARVESTING (RWH) SYSTEM IN COLLEGE CAMPUS

The implementation of a Rainwater Harvesting (RWH) system in the college campus is an effective and sustainable method adopted to conserve water and promote environmental responsibility on campus. The system collects rainwater from rooftops and open areas, channels it through pipes, and stores it in tanks or directs it to recharge pits. This harvested water is then used for purposes such as gardening, toilet flushing, cleaning, and groundwater recharge.

By implementing rainwater harvesting, the college reduces its dependence on municipal water supply, conserves valuable freshwater resources, and helps maintain the groundwater table. It also serves as a practical learning model for students, encouraging awareness about water conservation and sustainable living practices. Overall, the system reflects the institution's commitment to environmental stewardship and resource management.
